

Transcutaneous Electrical Nerve Stimulation

Features of the neurotechnology

- Transcutaneous Electrical Nerve Stimulation (TENS) involves the use of external electrodes, that use electricity to stimulate peripheral nerves.
- It doesn't involve any surgery, making it less expensive than implantable devices.
- Self-adhering electrode pads are placed on the skin of the area being targeted.
- It is removable.
- It is portable and allows the patients to have some control of the device settings.
